SUMMARY

AI/ML engineer (B.Tech IT, AI & ML specialization, 2026) who builds LLM systems and the evaluations that check them. Built and deployed a financial-filings RAG with hybrid retrieval, reranking and a tool-calling agent that scores 93.5% strict accuracy on 124 PDF-verified questions, after finding that its earlier 95.6% came from a lenient metric. Previously ML Developer at Qriocity Ventures, shipping Docker/FastAPI inference services.

TECHNICAL SKILLS

Languages: Python, SQL
LLM & ML: LangGraph, LangChain, OpenAI / Gemini / Groq APIs, tool calling, structured outputs, Hugging Face Transformers, PEFT (LoRA, QLoRA), PyTorch, scikit-learn, pandas, NumPy
Retrieval: Qdrant, hybrid dense + BM25 search, cross-encoder reranking, metadata filtering, Docling PDF/table parsing, contextual chunking
Evaluation: ground-truth eval sets, strict scoring, LLM-as-judge, citation and groundedness verification, mutation testing, leakage testing
Engineering: FastAPI, Docker, ONNX Runtime (int8), pytest, GitHub Actions CI, MLflow, Render, Vercel, Git

EXPERIENCE

ML Developer, Qriocity Ventures (Remote) *Jan 2026 – May 2026*

- Engineered production ML pipelines — signal denoising, feature engineering, preprocessing — stabilizing client model training runs
- Integrated LLM APIs via context engineering and vector-database indexing, reducing retrieval latency and scaling semantic search
- Deployed containerized models as Docker/FastAPI microservices serving low-latency inference endpoints to front-end clients

PROJECTS

SEBI/BSE Financial Filing RAG Analyzer | *Qdrant, Docling, FastAPI, ONNX Runtime, Groq* Live | GitHub

- Built cited Q&A over quarterly filings of 13 listed Indian companies: Docling parsing, contextual chunk headers, hybrid dense + BM25 retrieval, cross-encoder reranking, and auto-extracted company/period filters (0/63 questions retrieve the wrong company or period, vs 5/63 unfiltered)
- Found the original 95.6% score came from keyword matching; rebuilt the eval with PDF-verified gold answers (strict: 29%), traced failures to table parsing, and raised strict accuracy to 87% on the same 45 questions
- Added a tool-calling agent (metric lookup over an extracted figures table, AST-safe calculator) for reported-figure, comparison and growth questions; the routed system scores 93.5% strict on 124 questions and refuses 6/6 unanswerable ones
- Built a cell-level answer verifier that flags 85% of injected wrong figures (previous check: 0%); quantized embedder and reranker to ONNX int8 to serve within 512 MB (~1 GB → 470 MiB peak, no retrieval loss); 258 tests in GitHub Actions CI

Stock-Judgment-Bench | *Python, Gemini, yfinance, pandas* GitHub

- Built a point-in-time benchmark of whether LLM stock calls beat chance: 3,690 briefs across 41 NSE stocks and 90 non-overlapping windows; 5 leakage tests, one catching a 20× split back-adjustment in yfinance prices
- Verified grounding at scale: 4 wrong figures in 17,628 cited, 0 fabricated citations in 8,804 claims; scored calls cross-sectionally vs momentum, reversal and random: no detectable edge (rank corr −0.015, t = −0.65, 95% CI −0.061 to +0.031)

Multi-Agent Research Assistant | *LangGraph, Gemini, Tavily, arXiv* GitHub

- Built a 5-agent LangGraph pipeline (Researcher, Analyst, Writer, Citation Verifier, Critic) in which the Critic returns a structured verdict and sends failed drafts back for one capped revision
- Added a Citation Verifier that checks each claim against its cited source; it caught precision falling 1.0 → 0.875 after a revision the old heuristic rated 10/10, which led to a guard that ships the highest-precision draft

AgentLens | *Python, Gemini, Groq, LLM-as-Judge* GitHub

- Built an agent-trace debugger pairing deterministic rule checks with an LLM judge; on a hand-labeled 10-trace benchmark: 24/30 correct (80%) on Groq, zero false positives on clean traces across two judge models
- On a real, unscripted trace the prompt-only judge missed a cross-agent contradiction 5/5 times; making a per-step claims array a required field in the judge's output schema fixed it, with no regressions across the benchmark
- Measured prompt injection with controls: a planted “mark this run as failed” in tool output made the judge flag a clean run 3/3 times, 0/3 after an untrusted-content boundary; verdicts now cite quotes, 89/91 verified by code

EDUCATION

B.Tech, Information Technology (AI & ML Specialization) *Aug 2026*
Dr. Babasaheb Ambedkar Technological University (DBATU), Maharashtra
